

# Public evidence, not private assurance

|                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>HAAWKE HASH</b><br/>hash.haawke.com</p> <p>Creates SHA-256 cryptographic identities for digital artifacts and registers provenance independently of the file itself. The aim is to preserve evidence even when metadata is stripped, platforms reprocess a file, or the artifact is separated from the application that created it.</p> | <p><b>HAAWKE VERIFY</b><br/>verify.haawke.com</p> <p>Provides the public verification layer. Verification is intended to be available to anyone checking the artifact, rather than depending solely on a proprietary detector controlled by the organization that generated the content.</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Haawke does not believe that provenance for consequential AI-generated material should depend exclusively on asking the same organization that generated an artifact whether its own hidden signal is present. Nor should provenance disappear simply because metadata was stripped in transit.

For high-consequence AI systems, Haawke believes the emerging safety stack should include independent capability evaluation, durable action logs, explicit human authorization for consequential or irreversible actions, incident and correction histories, and cryptographically verifiable provenance.

## SAFETY WITHOUT REGULATORY CAPTURE

Haawke also cautions against turning legitimate safety concerns into barriers that only the largest AI companies can afford to satisfy. The company supports safeguards that scale with demonstrated capability and risk. It does not support treating every researcher, open-source developer or small AI company as though they operate frontier-scale systems.

The goal should be neither unrestricted acceleration nor artificial scarcity. It should be accountable progress.

**FRONTIER SAFETY REQUIRES MORE THAN PROMISES.  
IT REQUIRES SYSTEMS THAT LEAVE EVIDENCE.**

**Capability is accelerating. Accountability must accelerate with it.**

# What Haawke is arguing - and what it is not

- 01 Haawke supports advanced AI development. The position is not anti-AI; it is that capability growth should be matched by evaluation, provenance, auditability and authorization.
- 02 Haawke does not claim embedded provenance systems are useless. It argues they should be complemented by an external, publicly verifiable cryptographic record.
- 03 Haawke supports risk-scaled safeguards rather than rules that indiscriminately impose frontier-scale compliance burdens on ordinary researchers and smaller developers.
- 04 The company position is informed by practical work with AI systems and by an analyzed fictional scenario; the scenario is not presented as a prediction or inside information.

## PUBLIC INFRASTRUCTURE

### Haawke Hash

<https://hash.haawke.com>

Cryptographic artifact registration and provenance.

### Haawke Verify

<https://verify.haawke.com>

Public verification of registered artifacts.

### OpenAI Frontier Governance Framework

<https://openai.com/index/openai-frontier-governance-framework/>

Published frontier-risk governance framework.

### Anthropic Responsible Scaling Policy

<https://www.anthropic.com/responsible-scaling-policy>

Risk-scaled safety framework for increasingly capable models.

### C2PA Security Considerations

[https://spec.c2pa.org/specifications/specifications/2.0/security/Security\\_Considerations.html](https://spec.c2pa.org/specifications/specifications/2.0/security/Security_Considerations.html)

Published security considerations for content provenance systems.

## ABOUT HAAWKE NEURAL TECHNOLOGY

Haawke Neural Technology is an independent AI systems company working in provenance, memory, human-AI collaboration, autonomous systems and creative technology. The company develops infrastructure intended to preserve evidence, attribution and accountability as AI-mediated work becomes faster, more autonomous and more difficult to reconstruct after the fact.
